SUMMARY

Computational chemist (Ph.D., Spring 2026) with demonstrated impact across four industry and government-sponsored programs. Builds and deploys multiscale simulation workflows spanning MLIP development, molecular dynamics, and DFT to translate atomistic findings into actionable materials design decisions. Contributed to reactive MLIP development through Active Learning in a collaborative project, delivered a 100-fold MOF diffusivity performance improvement, first-ever thermophysical baselines for an industrial additive pipeline, and a validated computational protocol adopted by a DoE nuclear fuel purification program. Two first-author publications in peer-reviewed journals.

EXPERIENCE

Research Associate - Computational Chemistry July 2026 – Sept 2026
University of Pittsburgh *Sponsor: Naval Research Laboratory*

- Built an end-to-end Python pipeline for high-throughput electronic structure analysis, parsing Gaussian output at scale to extract bond order information such as condensed-to-atoms density matrices; exported to sharded HDF5 for downstream ML training on QM9-scale datasets.

Doctoral Researcher Aug 2020 – May 2026
Swanson School of Engineering, University of Pittsburgh, Pittsburgh, PA
Thesis: Atomistic modeling of Zr-based Metal-Organic Frameworks and stainless steel using classical and quantum mechanical methods

Machine Learning Interatomic Potentials for Reactive Systems *Funded by DTRA*

- To resolve catalytic performance loss that DFT could not explain at scale, ran 100+ molecular dynamics simulations of catalytic kinetics in an expanded system and identified surface poisoning as the root-cause failure mechanism.
- To reduce the high cost of training-data generation, benchmarked an in-house active learning protocol against the published standard using statistical metrics, cutting compute hours 50% at better accuracy and adding a latent-space uncertainty metric to validate data novelty.
- Built a machine-learned interatomic potential as a fast surrogate for DFT, combining a physics-based training set with data-driven uncertainty quantification to model reactive chemistry at scales first-principles methods cannot reach.

Transport Modeling in Defective Porous Materials *Funded by DTRA*

- Modeled the physics of molecular transport through a defective nanoporous material with molecular dynamics (LAMMPS) and grand canonical Monte Carlo (RASPA), then applied statistical analysis across 10 independent trajectories per data point to extract diffusion coefficients and resolve a 100-fold transport improvement from targeted defect engineering.
- Built a data-driven structure-property model linking defect configuration and concentration to diffusivity, identifying the physical variables controlling transport across four concentrations in hydroxylated variants.
- Used collective variables (CV) and umbrella sampling to calculate the diffusivities of slow-moving toxic molecules in pristine UiO-66 using a classical potential, implementing dynamically corrected transition state theory.

Reaction Pathway & Electronic Structure Modeling *Funded by DTRA*

- Modeled the reaction energetics governing surface hydrolysis using first-principles DFT (VASP) and CI-NEB transition-state calculations, establishing the binding mechanism controlling reaction rates across four chemistries.
- Generated DFT-based electronic-structure signatures (IR spectra) to connect the atomistic model to experimentally measurable observables for validation.

Reactive Force Field Model for Corrosion Physics *Funded by Naval Research Laboratory*

- Building a reactive force field model (Cr/O/Cl ReaxFF, LAMMPS) parametrized from first-principles data to capture the chemistry of chloride-induced pitting corrosion in oxide films at atomic resolution (ongoing NRL-funded work).

Thermophysical Property Model for Additive Screening *Funded by Lubrizol Corporation*

- Built a statistical-mechanical model (Gibbs ensemble Monte Carlo, Cassandra) to predict critical temperature and pressure for molecules with no experimental reference, validated within 10% of available data to give a synthesis-prioritization baseline.
- Applied dimensionality reduction and data visualization to a conformational dataset to model the structure-property link between molecular geometry and dipole moment.

Graduate Student Intern May 2023 – Nov 2023
Chemical Separations Group, Oak Ridge National Laboratory, Oak Ridge, TN

- Built and benchmarked six free-energy solvation models against experimental data, using quantitative model-selection to deliver the validated best performer as the adopted DoE program standard.
- Applied data-driven structure-activity modeling across 10+ molecular modifications to rank candidates and accelerate the experimental design cycle.

EDUCATION

Ph.D., Chemical Engineering Aug 2020 - May 2026
University of Pittsburgh, Pittsburgh, USA GPA: 3.54/4.0
Advisors: Prof. J. Karl Johnson and Prof. John Keith

Bachelor of Chemical Engineering Aug 2016 – Aug 2020
Institute of Chemical Technology, Mumbai, India GPA: 3.36/4.0

SKILLS

Simulation	DFT, MD (FEP, metadynamics, MSD), MLIP development, GCMC, Gibbs ensemble MC, ReaxFF parametrization, vibrational frequency analysis
Software	LAMMPS, VASP, PLUMED, WHAM, PACKMOL, Gaussian, Orca, Quantum Espresso OpenMM, openbabel, CREST, pymol, RASPA
Machine Learning	PyTorch, TensorFlow, DeepMD (active learning), MACE, UMA, scikit-learn, CNN, GAN, VAE, equivariant neural networks, WandB, Google Cloud, AWS
Programming	Python (numpy, pandas, scipy, ASE, RDKit, UMAP, pymatgen, catkit, multiprocessing), Linux/Bash, MATLAB, SQL, Git, HPC (Slurm, GPU), LaTeX
Data & Reports	Microsoft Office Suite, Power BI, DB Browser

SELECTED PRESENTATIONS (7 OF 11)

LEADERSHIP

Board Member, Engineering Graduate Student Organization (EGSO), University of Pittsburgh 2022 – 2025
Roles: Vice President, Secretary, Professional Development Officer
Coordinated graduate student events across the School of Engineering; managed a team of eight in planning and logistics for 500+ engineering graduates.

Teaching Assistant, University of Pittsburgh 2022 – 2024
Chemical Reaction Engineering, Chemical Engineering Thermodynamics, Mathematical Methods (avg. class size: 50). Developed course material and capstone projects.

AWARDS AND CERTIFICATIONS

- Pharmaceutical Formulations, Schrödinger Inc. 2026
- Introduction to Large Language Models, LinkedIn Learning 2025
- Deep Learning with PyTorch: Generative Adversarial Networks, Coursera 2025
- DTRA Grant: Computational design and ML-assisted search for dual-function MOFs towards nerve and blistering agent detoxification 2023
- ACS Reviewer Lab 2021
- Ongoing:
  - Databases and SQL for Data Science with Python, IBM/Coursera
  - Statistical Thinking for Industrial Problem Solving, JMP/Coursera
  - Building AI agents and Agentic Workflows, IBM/Coursera
  - Applied Bayesian Data Analytics, University of Pittsburgh/Coursera
